

## Off Season Storage

### Lift Tech Marine Off Season Storage Recommendations

#### **Motor Protection:**

Use our off season storage cover designed specifically for the direct drive motors. Important: Do not cover the motor with any type of plastic, as this can trap moisture and cause damage.

#### **Solar Panel Care and Charge Regulator:**

We recommend removing both the solar panel and the charge regulator during off season storage. This helps prevent unnecessary wear.

#### **Pendant:**

We recommend removing the pendant during off-season storage. This helps protect it from weather exposure, and ensures it's ready for use when the season begins again.

#### **Battery Storage:**

For best results, contact your battery manufacturer directly for their recommended off-season storage practices. This ensures your battery remains in optimal condition.

#### **DC Motors:**

You may apply dielectric grease to the grey connectors that join the motor and the battery wire. This helps protect against moisture, corrosion, and ensures a reliable electrical connection during storage and future use.

#### **Winch:**

We recommend lubricating the chains and sprocket with white lithium grease. This type of grease provides longer-lasting protection and does not wash off as easily as WD-40.

#### **Lift:**

For best results, contact your Lift manufacturer directly for their specific off season storage recommendations. Following the manufacturer's guidance ensures proper care and helps maintain warranty coverage.
